

What is claimed is:

1. A method for displaying a color image by reproducing a pixel color of an input image using three
5 types of cells having different light colors, the method comprising the steps of:

using a display device including a display screen having parallel cell columns, cells of each cell column having the same light color, a light color of a cell
10 column being different from that of the neighboring cell column, a cell position in the column direction of a cell column being shifted from that of the neighboring cell column among a set of the cell columns each having the same light color; and

15 switching a combination of cells having the same light color constituting a display line perpendicular to the column direction.

2. The method according to claim 1, wherein the switching of the combination of cells constituting a
20 display line is performed for each field when the input image is displayed in an interlace format.

3. A method for displaying a color image by reproducing a pixel color of an input image using three
25 types of cells having different light colors, the method comprising the steps of:

using a display device including a display screen having parallel cell columns, cells of each cell column having the same light color, a light color of a cell
30 column being different from that of the neighboring cell column, a cell position in the column direction of a cell

009933207 111604

column being shifted from that of the neighboring cell column among a set of cell columns each having the same light color; and

determining luminance of each cell of the display screen by distributing a luminance value of each pixel of an input image to plural cells corresponding to the pixel or by integrating luminance values of plural pixels of the input image into a cell corresponding to the pixel in accordance with a cell position relationship between an imaginary display screen having a cell arrangement corresponding to a pixel arrangement of the input image and the display screen.

4. A method for displaying a color image by reproducing a pixel color of an input image using three types of cells having different light colors, the method comprising the steps of:

using a display device including a display screen having parallel cell columns, cells of each cell column having the same light color, a light color of a cell column being different from that of the neighboring cell column, a cell position in the column direction of a cell column being shifted from that of the neighboring cell column among a set of cell columns each having the same light color; and

lighting two neighboring cells in at least one cell column out of a set of cell columns each having the same light color when displaying a display line perpendicular to the column direction.

5. The method according to claim 4, wherein two neighboring cells are lighted in all the plural cell

6. The method according to claim 4, wherein two neighboring cells are lighted in every other cell columns having the same light color, and one cell is lighted in the remaining cell columns.

8. The method according to claim 4, wherein the display device is a plasma display panel.

a driving circuit for lighting two neighboring cells
in at least one cell column having the same light color
25 when displaying a display line perpendicular to the column
direction.
